

STEP-BY-STEP DIRECTIONS

1. Place the Optional Ground Pad on a level Surface.

2. Position tank on center of Ground Pad.

3. Connect hose to tank. Begin filling tank with clean pond water before pond is drained. **Avoid hot surface water or muddy water.**

4. Pull on bottom edge of tank to remove wrinkles from tank floor.

5. Place airstones in center of holding tank.

6. Start air blower and continue filling the holding tank with water. The blower will begin to saturate the water with oxygen.

7. Determine depth needed to adequately hold fish.

Half full = 250 gallons.

Full tank = 500 gallons.

Close valve and leave hose connected. Put on cover net.

8. Add the recommended amount of broad spectrum fish health protection to holding tank to reduce stress.

9. Collect the fish from the pond. Always use a Sock Net when handling Koi or Goldfish.

Transfer fish from pond into tank with ease.

10. Gently place fish into the tank & release.

11. Secure the cover net.

Fish feel secure in holding tank.

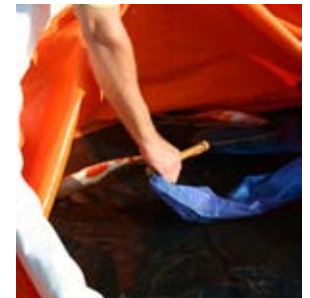

12. When the pond is ready to accept

fish, drain tank to an acceptable level back through fill hose and close valve.

13. Capture fish with sock net and return to the pond.

14. Empty remaining water. Sterilize, dry and return to storage bag.

SELF-SUPPORTING FISH HOLDING TANK KIT

Tank Dimensions: 2'8" x 5' x 6'6" (folded 24" x 17")
Approximate Weight 50 lbs.

Price:

Tank Kit

- 500 gallon tank ~ \$787.20
